**Techniques of the Observer** Aug 02 2022 Jonathan Crary's Techniques of the Observer provides a dramatically new perspective on the visual culture of the nineteenth century, reassessing problems of both visual modernism and social modernity. This analysis of the historical formation of the observer is a compelling account of the prehistory of the society of the spectacle. In Techniques of the Observer Jonathan Crary provides a dramatically new perspective on the visual culture of the nineteenth century, reassessing problems of both visual modernism and social modernity. Inverting conventional approaches, Crary considers the problem of visibility not through the study of art works and images, but by analyzing the historical construction of the observer. He insists that the problems of vision are inseparable from the operation of social power and examines how, beginning in the 1820s, the observer became the site of new discourses and practices that situated vision within the body as a physiological event. Alongside the sudden appearance of physiological optics, Crary points out, theories and models of "subjective vision" were developed that gave the observer a new autonomy and productivity while simultaneously allowing new forms of control and standardization of vision. Crary examines a range of diverse work in philosophy, in the empirical sciences, and in the elements of an emerging mass visual culture. He discusses at length the significance of optical apparatuses such as the stereoscope and of precinematic devices, detailing how they were the product of new physiological knowledge. He also shows how these forms of mass culture, usually labeled as "realist," were in fact based on abstract models of vision, and he suggests that mimetic or perspectival notions of vision and representation were initially abandoned in the first half of the nineteenth century within a variety of powerful institutions and discourses, well before the modernist painting of the 1870s and 1880s.

**Tools and Techniques of Leadership and Management** Jan 03 2020

Many of today's books on the tools and techniques of leadership and management provide descriptions of long lists for use in decision-making, leading, coaching and project management. This book takes a completely different approach. It contests the claims that the tools and techniques are based on evidence and explains why human activities of leading and managing are simply not amenable to scientific proof and consequently, why long-term futures of organizations are unpredictable. The book undertakes a critical exploration of just what these tools and techniques are about; showing that while they may lead to competent performance they cannot go further to expert performance because expertise involves going beyond rules and procedures. Ralph Stacey investigates the many questions that are thrown up as a result of this

new approach. Questions such as: How do we apply this new way of thinking? What are the practical tools and techniques it gives us? What is the role of leaders in an unpredictable world? How does complexity affect the way organizations are structured and function? This book will be relevant to students on courses and modules that deal with leadership, decision-making and organizational development and behaviour as well as professional leaders and managers who want to develop their own understanding and techniques.
