The Analysis of Solutions of Elliptic Equations Jan 15 2021 This book is intended as a continuation of my book "Parametrix Method for the Theory of Differential Complexes" (see [291]). There, we considered complexes of differential operators between sections of

and we strived more than for details. Although there are many applications to for maximal generality overdetermined system approach left me with a certain feeling of dissatisfaction, especially since a large number of interesting consequences can be obtained without a great effort. The present book is conceived as an attempt to shed some light on these new applications. We consider differential operators having a simple structure on open subsets of R^n . Currently, this area is not being investigated very actively because it is already very highly developed actively (cf. for example the book of Palamodov [213]). However, even in this (we) situation the general ideas from [291] allow us to obtain new results in the qualitative theory of differential equations and in definitive form. The greater part of the material presented is related to applications of the Laurent series for a solution of a differential equations, which is a convenient way of writing the Green formula. The culminating application is an analog of the Vitushkin [303] for uniform and mean approximation by solutions of an elliptic system. Somewhat afield are several questions posedness, but the parametrix method enables us to obtain here a series of hitherto unknown facts.

Inflation and String Theory, Cambridge University Press, 2019, ISBN 978-1-107-18111-9
The past two decades have seen transformative advances in cosmology and string theory. Observations of the cosmic microwave background have revealed strong evidence for inflationary expansion in the very early universe, while new insights about compactifications of string theory have led to a deeper understanding of inflation in a framework that unifies quantum mechanics and general relativity. Written by two of the leading researchers in the field, this complete and accessible book provides a modern treatment of inflationary cosmology and its connections to string theory and elementary particle theory. In addition to a date experimental summary, the authors present the foundations of effective field theory, string theory, and string compactification. The book is the stage for a detailed examination of models of inflation in string theory. Three appendices contain background material in cosmological perturbation theory, making this a self-contained resource for graduate students and researchers in string theory and related fields.

Set Optimization and Applications - The State of the Art, John Wiley & Sons, 2020, ISBN 978-1-119-51251-9
This volume presents five surveys with extensive bibliographies and six original contributions on set optimization and its applications in mathematical finance and game theory. The topics range from conventional approaches that look for minimal/maximal elements with respect to vector orders or set relations, to the new approach that comprises a coherent solution concept for set optimization problems, along with existence results, duality theory, optimality conditions, variational inequalities and theoretical foundations for algorithms. Modern approaches to scalarization and vector optimization can be found as well as a fundamental contribution to conditional analysis. The theory is tailor-made for financial applications, in particular for risk evaluation and [super-]hedging for market models with transaction costs, but it also provides a refreshing new perspective on set optimization. There is no comparable volume on the market, making the book an invaluable resource for researchers working in set optimization and multi-criteria decision-making, mathematical finance and economics as well as [set-valued] variational analysis.

Convex Optimization Theory Nov 20 2021 An insightful, concise, and rigorous treatment of the basic theory of convex sets and optimization in finite dimensions, and the analytical/geometrical foundations of convex optimization and duality theory. Convexity theory is first presented in a simple accessible manner, using easily visualized proofs. Then the focus shifts to a transparent geometrical line of analysis, with the fundamental duality between descriptions of convex functions in terms of points, and in terms of hyperplanes. Finally, convex and abstract duality are applied to problems of constrained optimization, Fenchel and conic duality, and game theory to derive the sharpest possible duality results within a highly visual geometric framework. This on-line version of the book, includes an extensive set of theoretical problems with detailed high-quality solutions, which significantly extend the range and value of the book. The book can be used as a text for a theoretical convex optimization course; the author has taught several variants of such a course at MIT and elsewhere in the last ten years. It may also be used as a supplementary source for nonlinear programming classes, and as a theoretical foundation for classes focused on convex optimization models (rather than theory). It is an excellent supplement to several of our books: Convex Optimization Algorithms (Athena Scientific, 2015), Nonlinear Programming (Athena Scientific, 2017), Network Optimization (Athena Scientific, 1998), Introduction to Linear Optimization (Athena Scientific, 1997), and Network Flows and Monotropic Optimization (Athena Scientific, 1998).

Fixed Income Securities Aug 06 2020 The deep understanding of the forces that affect the valuation, risk and return of fixed income securities and their derivatives has never been so important. As the world of fixed income securities becomes more complex, students studying fixed income securities must be exposed more directly to this complexity. This book provides a thorough discussion of fixed income securities, the forces affecting their prices, their risks, and of the appropriate risk management practices. Fixed Income Securities, however, provides a methodology, and not a shopping list. It provides instead examples and methodologies that can be applied universally, once the basic concepts have been understood.

Utility Maximization in Nonconvex Wireless Systems Sep 26 2019 This monograph develops a framework for modeling and solving utility maximization problems in nonconvex wireless systems. The first part develops a model for utility optimization in wireless systems. The model is general enough to encompass a wide array of system configurations and performance objectives. Based on the general model a set of methods for solving utility maximization problems is developed in the second part of the book. The development is based on an examination of the properties that are required for the application of each method. This part focuses on problems whose initial formulation does not allow for a solution by standard methods and discusses alternative approaches. The last part presents two case studies that demonstrate the application of the proposed framework. In both cases, utility maximization in multi-antenna broadcast channels is investigated.

The William Lowell Putnam Mathematical Competition 1985–2000: Problems, Solutions, and Comments Jun 08 2020 This third volume of problems from the William Lowell Putnam Competition is unlike the previous two in that it places the problems in the context of important mathematical themes. The authors highlight connections to other problems, to the curriculum and to more advanced mathematics. The best problems contain kernels of sophisticated ideas related to important current research, and yet the problems are accessible to undergraduates. The solutions have been compiled from the American Mathematical Monthly, Mathematics Magazine and past Putnam competitors.
